

Rapport-preuve - Validation des *metrics* extraits (NS4KGE)

Corpus : **55 articles** - Source : Configurations[].Metric (prompt2) - Validation contre load_md_tables_only() (tables uniquement).

1. Définitions

Terme	Définition
TP	metric extrait par le KG ET présent dans les tableaux de l'article
FP	metric extrait par le KG mais absent des tableaux
Candidat FN	metric présent dans une cellule <table> mais non extrait
Précision	$TP / (TP + FP)$
Recall relatif	$TP / (TP + \text{candidats FN en table de résultats})$

Méthodo (matching) : metrics normalisées par le prompt (ex. Mean Rank->MR, Hit@10->Hits@10, Acc->Accuracy) donc matching par **alias déterministes** ; Hits@N/Hits@k générique accepté en précision ; recall cherché dans les blocs <table> avec N littéral.

2. Résultats globaux

Indicateur	Valeur
Metrics extraits (lignes vérifiées)	199
Validés (TP)	192
Non validés (FP)	7
Précision (micro)	96.5%
Candidats FN en table de résultats	8
Candidats FN en table de stats (ignorés par le prompt)	0
Recall relatif (micro)	96.0%
Vocabulaire global de metrics	18

3. Analyse des erreurs

3.1 Faux positifs (extraits mais absents des tableaux)

Article	Metric extrait
ConceptDriven.md	Accuracy
GNDN.md	Accuracy
LTS.md	Hits@1
NSCaching.md	Accuracy
RUGA.md	Accuracy
RUGA.md	MR
SparseNSG.md	Accuracy

3.2 Candidats faux négatifs - table de résultats
